# A Relation

- Relation  $\neq$  Relationship (of Entity-Relationship Model)
- Relation = Entity / DBMS Table
- Attributes Name = DBMS Columns
- Tuples = DBMS rows

# A Relation

- A **relation** looks like a **table** filled with values
- Each **column** has a **column header** similar to **attribute** name
- The data elements in each **row** is the value of **attributes**
- Relational Model is proposed by Dr. E.F. Codd 1970.
  - He got Turing Award later

# A Relation

- A relation looks like **set of rows (tuples)**
  - ***Unordered rows*** (Note: Set is a unordered list)

Diagram illustrating a relation (table) and its tuples (rows).

The relation is named **STUDENT**. The attributes (columns) are: Name, Ssn, Home\_phone, Address, Office\_phone, Age, and Gpa.

The tuples (rows) are:

Name	Ssn	Home_phone	Address	Office_phone	Age	Gpa
Benjamin Bayer	305-61-2435	373-1616	2918 Bluebonnet Lane	NULL	19	3.21
Chung-cha Kim	381-62-1245	375-4409	125 Kirby Road	NULL	18	2.89
Dick Davidson	422-11-2320	NULL	3452 Elgin Road	749-1253	25	3.53

Barbara Benson	533-69-1238	839-8461	7384 Fontana Lane	NULL	19	3.25

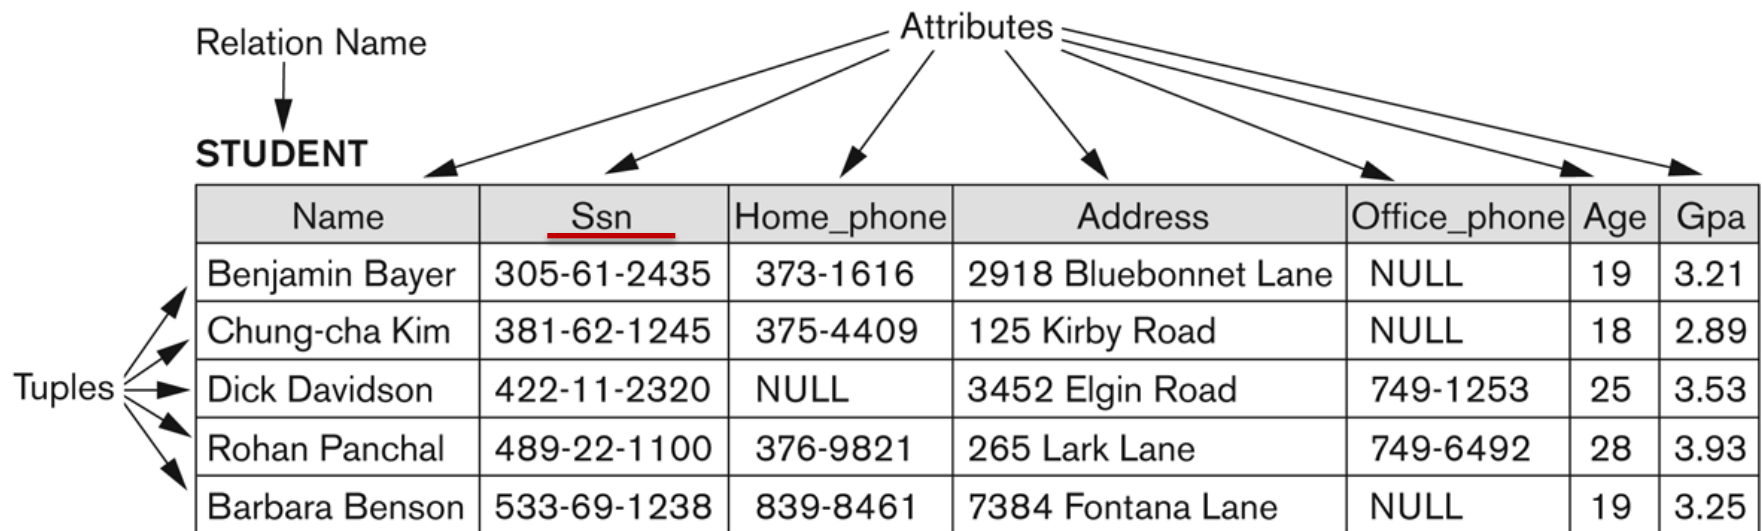

The same relation is shown below, but with a different order of tuples:

Name	Ssn	Home_phone	Address	Office_phone	Age	Gpa
Dick Davidson	422-11-2320	NULL	3452 Elgin Road	749-1253	25	3.53

Benjamin Bayer	305-61-2435	373-1616	2918 Bluebonnet Lane	NULL	19	3.21

Same Relation, Different order

# A Relation

- **Key** of a Relation: an **attribute** which *uniquely* identifies that particular row in the table. E.g., SSN
- Sometimes we create keys *artificially* (e.g., if no key exists)
- **Primary key**, *Pk*: A chosen key, example: SSN
  - If there are multiple keys, choose one

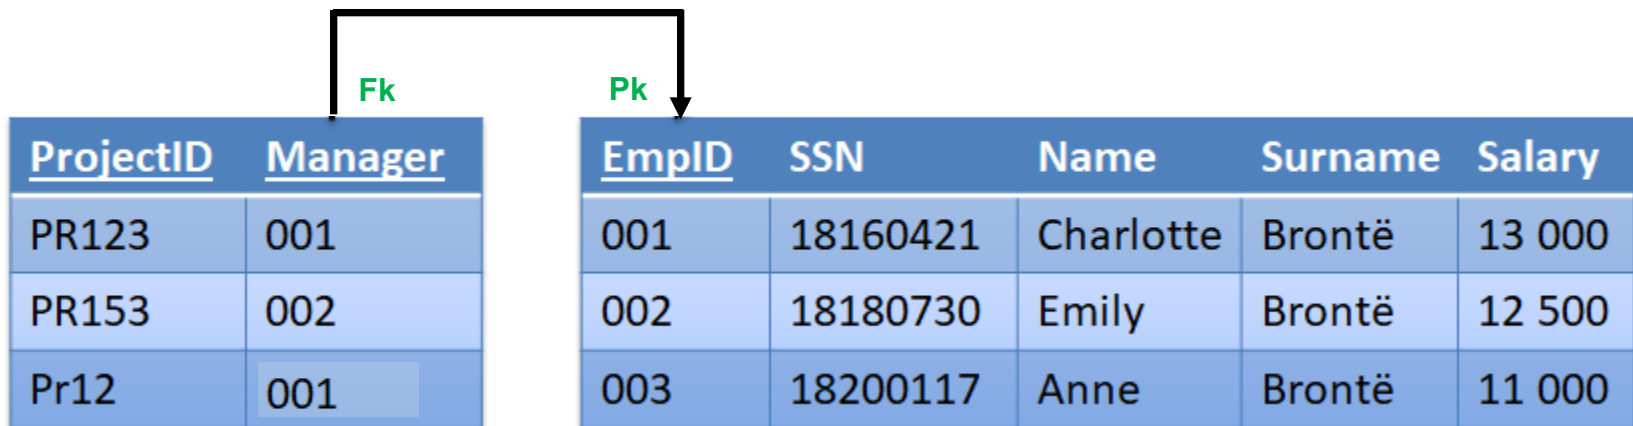

# Characteristics of Relations

- Values in a tuple:
  - Are atomic (indivisible/single-value).
  - No *multivalued data*
  - Each value in a tuple must be from the **domain** of the attribute
  - Value can be **null**
    - to represent: unknown/not available/inapplicable

# A Relation

- **Foreign Key, *Fk***: A relation uses another relation's **primary key** as an **attribute**.

# Formal Definitions

- **The Schema:** description of a Relation
  - $R(A_1, A_2, \dots, A_n)$
  - $R$  name of a relation,
  - $A_1, A_2, \dots, A_n$  are the attributes of the relation
- Example: STUDENT(Name, SSN, Home\_phone..., Gpa)
  - Relation name *STUDENT*, attributes: *Name, SSN.... Gpa*
- **Domain:** each attribute has a set-of-values/data-type
  - Example: integer, date, varchar(256), etc.

**STUDENT**

Barbara Benson	533-69-1238	839-8461	7384 Fontana Lane	NULL	19	3.25

# Formal Definitions

- A **tuple** is an **ordered** set of values of attributes
  - written inside **<...>**
- **Example:**
  - **<“Benjamin Bayer”, “305-61-2435”, “373-1616”, 2918 Bluebonnet Lane”, ....>**
- **Order of attribute values matter**

# Formal Definitions - Summary

- Formally,
  - Given  $R(A_1, A_2, \dots, A_n)$
- $R(A_1, A_2, \dots, A_n)$  is the **schema** of the relation
- $R$  is the **name** of the relation
- $A_1, A_2, \dots, A_n$  are the **attributes** of the relation
- Let  $\text{dom}(A_1) = \{0, 1\}$
- $r(R)$ :
  - *Table / set of tuples/rows*
    - $r(R) = \{t_1, t_2, \dots, t_n\}$  where each  $t_i$  is an  $n$ -tuple
    - Here,  $t_i = \langle v_1, v_2, \dots, v_n \rangle$  where each  $v_j$  *element-of*  $\text{dom}(A_j)$
  - A specific **state/value/population** of relation  $R$

# Populated database

- Basic operations for changing the database:
  - INSERT: a new tuple
  - DELETE: an existing tuple
  - MODIFY: an existing tuple
- New database *state* arises after every operation

DB must be in a *valid-state* after every operation.

# Relational Integrity Constraints

- Constraints are **conditions** that must hold on **all valid states** (after every INSERT, UPDATE, DELETE)
- 3 type of constraints (**3Cs**):
  - **Key** constraints
  - **Entity integrity** constraints
  - **Referential integrity (Foreign Key)** constraints

# 1. Key constraints

- If a relation has several *candidate keys*, one is chosen arbitrarily as a **primary key**. [Optional]
- The primary-key value is used to ***uniquely identify*** each tuple in a relation.
- PK is used to reference the tuple from another tuple (FK)
  - General rule: Choose as primary key the smallest of the candidate keys (in terms of size)

CAR

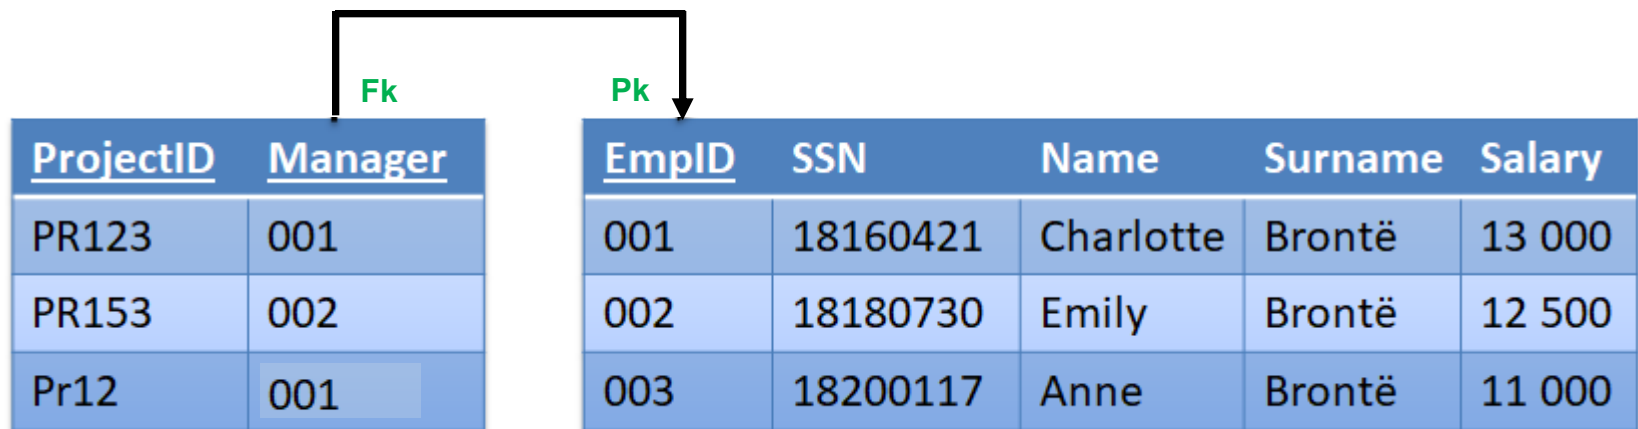

<u>License_number</u>	Engine_serial_number	Make	Model	Year
Texas ABC-739	A69352	Ford	Mustang	02
Florida TVP-347	B43696	Oldsmobile	Cutlass	05
New York MPO-22	X83554	Oldsmobile	Delta	01

California RSK-629	Y82935	Toyota	Camry	04
Texas RSK-629	U028365	Jaguar	XJS	04

## 2. Entity Integrity Constraints

- The ***primary key*** attributes cannot be ***null***
  - Primary key values are used to *identify* the individual tuples
  - If PK has several attributes (i.e., composite PK), *null* is not allowed in any of these attributes
- Note: Although attributes of a relation (except PK) can have null values, we can still restrict it of not having null

# 3. Referential Integrity constraints

- Referential Integrity/Foreign Key (FK) Constraints: the value in the FK column(s) can be **either**:
  - (1) a value of an existing PK value from another relation
  - (2) a **null**

# Other types of Constraints

- Constraints can be defined using SQL-99 (or later)
  - *E.g., max.-no.-of-hours per employee can be set*
  - **CREATE TRIGGER** or **CREATE ASSERTION** using SQL
- CREATE TABLE statement in SQL allows:
  - Defining Keys/Candidate-Keys, restrict Null values, FKs, etc

```
CREATE TABLE Employee (  
    EmpID          int PRIMARY KEY,  
    SSN            int UNIQUE,  
    Name           varchar NOT NULL,  
    Surname        varchar NOT NULL,  
    Salary         int,  
    Supervisor     int references Employee(EmpID),  
    unique (Name, Surname)  
);
```

# Operations on Relations

DB must be  
in a hold **3Cs**  
after every  
*INSERT,*  
*DELETE,*  
*MODIFY*

- The 3Cs are:
  - **Key** constraints
  - **Entity integrity** constraints
  - **Referential integrity** constraints
